Abstract of DE19546984

The cold chest has at least one drawer (2) for goods to be cooled. There is a device (4) which seals the open top side of a drawer against the chamber inside and after the whole drawer is completely pulled out, seals off the front opening of the chamber from the inside. The device is a spring-loaded flap which automatically closes over the opening when the drawer is withdrawn. In another design, the flap consists of sealing lips on the drawer working with corresponding lips on the inner side of the front opening. The lips are mounted on a five-walled pocket which is detachably fastened on the inside end of the drawer concerned.
